

eMedical Sentry

Technology for health living

eMedicalSentry (eMed) is advancing remote care management as a standard of care by providing Health Data Management for patients with chronic diseases through wireless remote monitoring utilizing state of the art technology. eMedicalSentry products and services improves patient outcomes while reducing medical errors by integrating medical technology.

The value proposition for Physicians and Managed Care Organizations is to improve quality of care while reducing the cost of health care. We provide remote monitoring to hospitals and practitioners to help manage chronic diseases such as Congestive Heart Failure as well as manage patients with implantable cardiovascular devices.

Consultative Services

The goal of our partnership is to improve patient outcomes and reduce healthcare costs by:

- ▶ **Guiding** clients on the the appropriate devices that meet remote health monitoring needs
- ▶ **Understanding** your target patient population to improve the patient and caregiver dynamics
- ▶ **Integrating** remote monitoring solutions that meet your existing workflows and systems
- ▶ **Developing** solutions that reduce healthcare costs, hospital readmissions and ED visits
- ▶ **Empowering** patients to take control of their health through a holistic care management plan

Care Above & Beyond

Cardiovascular diseases affect 60M Americans and represents \$327B spent annually with chronic diseases as a whole representing \$700B spent annually. By extending care beyond clinical settings and into patients' homes, our goal is to empower patients to take a more active role in managing their health while connecting providers and caregivers for better continuity of care.

Most healthcare experts agree that efficiently extending care into the home is one potential solution to addressing the rising healthcare costs associated with hospital readmissions and avoidable emergency care. In addition, 90% of people age 65+ would rather stay at home as they age, according to **AARP**.

Remote Monitoring

eMed uses an innovative, cloud-based application that can significantly reduce the complexity and cost of deploying a clinically driven remote care management program. The eMed clinician application facilitates the collection of daily biometric data measurements and provides trending information that will enable health care providers to intervene early in the patients' condition thereby avoiding hospital readmission or ER visits.

With its cloud-based connectivity, the **eMed** patient application provides individuals with greater freedom and flexibility to participate in their own care remotely by daily transmission of biometric data points; accessing interactive health education; and providing immediate follow-up to and from their health care provider.
